

OVERVIEW

The 5076 series are miniature VCXO ICs that provide a wide frequency pulling range, even when using miniature crystal units for which a wide pulling range is difficult to provide. They employ a recently developed varicap diode fabrication process that provides a wide frequency pulling range and good linearity without any external components. Also, they employ a regulated voltage drive oscillator circuit that significantly reduces current consumption, crystal current, and oscillation characteristics supply voltage dependency. The 5076 series are ideal for miniature, wide pulling range, low power consumption, VCXO modules.

ABSOLUTE MAXIMUM RATINGS

$$V_{SS} = 0V$$

Parameter	Symbol	Conditions	Rating	Unit
Supply voltage range	V_{DD}	Between VDD and VSS	-0.5 to +5.0	V
Input voltage range ^{*1}	V_{IN}	Input pins	-0.5 to $V_{DD} + 0.5$	V
Output voltage range ^{*1}	V_{OUT}	Output pins	-0.5 to $V_{DD} + 0.5$	V
Storage temperature range	T_{STG}	Wafer form, chip form	-65 to +150	°C
Output current	I_{OUT}	Q pin	± 20	mA

*1. V_{DD} is a V_{DD} value of recommended operating conditions.

Note. Absolute maximum ratings are the values that must never exceed even for a moment. This product may suffer breakdown if any one of these parameter ratings is exceeded. Operation and characteristics are guaranteed only when the product is operated at recommended supply voltage range.

RECOMMENDED OPERATING CONDITIONS

$$V_{SS} = 0V$$

Parameter	Symbol	Conditions	Rating			Unit	
			Min	Typ	Max		
Operating supply voltage	V_{DD}	$C_{LOUT} \leq 15pF$	1.6	-	2.0	V	
Input voltage	V_{IN}	VC pin	V_{SS}	-	V_{DD}	V	
Operating temperature	T_{OPR}		-40	-	+85	°C	
Oscillation frequency ^{*1}	f_O	5076×1 to 5076×5	20	-	40	MHz	
		5076×J to 5076×N	40	-	55	MHz	
Output frequency	f_{OUT}	$C_{LOUT} \leq 15pF$	5076×1 to 5076×5	1.25	-	40	MHz
			5076×J to 5076×N	2.5	-	55	MHz

*1. The oscillation frequency is a yardstick value derived from the crystal used for NPC characteristics authentication. However, the oscillation frequency range is not guaranteed. Specifically, the characteristics can vary greatly due to crystal characteristics and mounting conditions, so the oscillation characteristics of components must be carefully evaluated.

Note. Mount a ceramic chip capacitor that is larger than 0.01 μ F proximal to IC (within approximately 3mm) between VDD and VSS in order to obtain stable operation of 5076 series. In addition, the wiring pattern between IC and capacitor should be as wide as possible.

FUNCTIONAL DESCRIPTION

Oscillation Start-up Detector Function

The devices also feature an oscillation start-up detector circuit. This circuit functions to disable the outputs until the oscillation starts. This prevents unstable oscillator output at oscillator start-up when power is applied.
